Ward: 10th

Date: March 23, 2006, 12:20 p.m.

Arrested? Yes

Domestic? No

Police district: 1st

Police beat: 0134

Composite apps step-by-step

Chicago offers online access to its police department's database of reported crimes (figure 1), allowing users to look up events by police beat, school or address. The site returns tables generated by an automated mapping system supplied by ESRI.

For its part, Google lets third parties access its mapping service. Developers submit locations using the exposed Google API and it returns a map (figure 2), which can then be embedded into a Web page.

Internet developer Adrian Holovaty created an online program that combines the two data services into a new application at ChicagoCrime.org (figure 3). The new service automatically fetches crime reports from the city's site and maps from Google.

Users can drill down to find more info on individual crime reports (figure 4).

And in the spirit of SOA-based composite apps, yet another developer created a widget that can display Chicago crime data on the Apple Macintosh desktop (figure 5).
